

## Commutative Algebra Mathematics Lecture Note Series

Thank you for reading commutative algebra mathematics lecture note series. Maybe you have knowledge that, people have look hundreds times for their chosen books like this commutative algebra mathematics lecture note series, but end up in harmful downloads. Rather than enjoying a good book with a cup of coffee in the afternoon, instead they juggled with some harmful virus inside their computer.

commutative algebra mathematics lecture note series is available in our book collection an online access to it is set as public so you can download it instantly. Our books collection spans in multiple countries, allowing you to get the most less latency time to download any of our books like this one. Kindly say, the commutative algebra mathematics lecture note series is universally compatible with any devices to read

A commutative ring with 1 is called a [eld](#) if  $1 \neq 0$  and for all  $0 \neq x \in A$  there exists an element  $x^{-1} \in A$  such that  $xx^{-1} = x^{-1}x = 1$ . In other words, every non-zero element of  $A$  is a unit. Clearly, every [eld](#) is an integral domain, but not conversely (e.g.  $\mathbb{Z}$ ). Note that if  $x$  is a unit, then  $(x)^{-1} = A = (1)$ . Also note that if  $x$  is nilpotent, then  $x$  is a unit.

Commutative Algebra is the study of commutative rings, and their modules and ideals. This theory has developed over the last 150 years not just as an area of algebra considered for its own sake, but as a tool in the study of two enormously important branches of mathematics: algebraic geometry and algebraic number theory.

The map  $\text{Spec}(B) \rightarrow \text{Spec}(A)$  corresponds to the projection to the  $(x, y)$ -plane of the surface  $F: xz = y^2$  in the  $(x, y, z)$ -space. Note  $F$  contains the whole  $z$ -axis and hence does not look flat over the  $(x, y)$ -plane. EXAMPLE 3. Let  $A = k[x, y]$  be as above and  $B = k[x, y, z]$  with  $z = f(x, y)$ .

[Commutative algebra \(Mathematics lecture note series\) -](#)

Commutative algebra is the branch of algebra that studies commutative rings, their ideals, and modules over such rings. Both algebraic geometry and algebraic number theory build on commutative algebra. Prominent examples of commutative rings include polynomial rings; rings of algebraic integers, including the ordinary integers  $\mathbb{Z}$ ; and  $p$ -adic integers. Commutative algebra is the main technical tool in the local study of schemes. The study of rings that are not necessarily commutative is called noncommutative algebra.

[Commutative algebra - Wikipedia](#)

Definition 2.2. Suppose we have a commutative subring  $A \subseteq R$  (with identity). An element  $r \in R$  is called integral over  $A$  if  $r^n + a_{n-1}r^{n-1} + \dots + a_0 = 0$  for some monic polynomial  $f(x) = x^n + a_{n-1}x^{n-1} + \dots + a_0 \in A[x]$ . Proposition 2.3 Given  $A \subseteq R$  a commutative subring, the set of integral elements is a subring. Lemma 2.4 Let  $A$  be a ring, and  $M$  a finitely-generated  $A$ -module. Let  $\varphi: M \rightarrow M$  be an  $A$ -linear map.

Further, every ring is commutative (that is,  $xy = yx$  in it), with an occasional exception, which is always marked (normally, it is a ring of matrices). As usual, the additive identity is denoted by 0. Note that, for any  $x$  in  $R$ ,  $x \cdot 0 = 0$ ; indeed,  $x \cdot 0 = x(0+0) = x \cdot 0 + x \cdot 0$ , and  $x \cdot 0$  can be canceled by adding  $-(x \cdot 0)$ . We allow  $1 = 0$ .
