This book explains how the performance of modern cellular wireless networks can be evaluated by measurements and simulations. With the roll-out of LTE, high data throughput is promised to be available to cellular users. In case you have ever wondered how high this throughput really is, this book is the right read for you: At first, it presents results from experimental research and simulations of the physical layer of HSDPA, WiMAX, and LTE. Next, it explains in detail how measurements on such systems need to be performed in order to achieve reproducible and repeatable results. The book further addresses how wireless links can be evaluated by means of standard-compliant link-level simulation. The major challenge in this context is their complexity when investigating complete wireless cellular networks.

Consequently, it is shown how system-level simulators with a higher abstraction level can be designed such that their results still match link-level simulations. Exemplarily, the book finally presents optimizations of wireless systems over several cells. This book:

- Explains how the performance of modern cellular wireless networks can be evaluated by measurements and simulations
- Discusses the concept of testbeds, highlighting the challenges and expectations when building them
- Explains measurement techniques, including the evaluation of the measurement quality by statistical inference techniques
- Presents throughput results for HSDPA, WiMAX, and LTE
- Demonstrates simulators at both, link- level and system-level
- Provides system-level and link-level simulators (for WiMAX and LTE) on an accompanying website

Northern Star explores Plaskett's unorthodox and fascinating life from his rural roots near Woodstock through his days as a technician at the University of Toronto to his initiation in astronomy at the Dominion Observatory in Ottawa.

"To teach correct Latin and to explain the poets" were the two standard duties of Roman teachers. Not only was a command of literary Latin a prerequisite for political and social advancement, but a sense of Latin's history and importance contributed to the Romans' understanding of their own cultural identity. Put plainly, philology-the study of language and texts-was important at Rome. *Critics, Compilers, and Commentators* is the first comprehensive introduction to the history, forms, and texts of Roman philology. James Zetzel traces the changing role and status of Latin as revealed in the ways it was explained and taught by the Romans themselves. In addition, he provides a descriptive bibliography of hundreds of scholarly texts from antiquity, listing editions, translations, and secondary literature. Recovering a neglected but crucial area of Roman intellectual life, this book will be an essential resource for students of Roman literature and intellectual history, medievalists, and historians of education and language science.

Antibodies are indispensable tools for research, diagnosis, and therapy. Recombinant approaches allow the modification and improvement of nearly all antibody properties, such as affinity, valency, specificity, stability, serum half-life, effector functions, and immunogenicity. "Antibody Engineering" provides a comprehensive toolbox covering the well-established basics but also many exciting new techniques. The protocols reflect the latest "hands on" knowledge of key laboratories in this still fast-moving field. Newcomers will benefit from the proven step-by-step protocols, which include helpful practical advice; experienced antibody engineers will appreciate the new ideas and approaches. The book is an invaluable resource for all those engaged in antibody research and development.
