Under lateral loading to assess group reliability by adopting a redundancy factor. Paikowsky suggested that the target reliability for pile group can be reduced to 2.0–2.5 compared to 3.0 for single piles. Pile groups may be able to support the design load when one or more piles are defective (e.g., ). If the reliability of

The piles installed can be a single pile or group piles. Hence the load calculation for a single pile and group pile will be different. This is done for given load condition or for the size of foundation. Here the load carrying capacity calculation for both single piles and group piles.

Behavior of single piles vs. group piles. The ability of a pile group to resist lateral loads is a significant design issue. The deflection of a pile group under a lateral load is typically
